-I. FUNCTION: THE HEPARIN-BINDING GROWTH FACTORS ARE ANGIGGENIC AGENT:
IN VIVO AND ARE POTENT MITOGENS FOR A VARLETY OF CELL TYPES IN
VITRO. THERE ARE DIFFERENCES IN THE TISSUE DISTRIBUTION AND
CONCENTRATION OF THESE 2 GROWTH FACTORS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            -i- TISSUE SPECIFICITY: FOUND IN ALL THE TISSUES EXAMINED.
-i- MISCELLANEOUS: THIS PROTEIN BINDS HEPARIN MORE STRONGLY THAN DOES

-: FUNCTION: THE HEPARIN-BINDING GROWTH FACTORS ARE ANGIGGENIC AGENTS
IN VIVO AND ARE POTENT MITOGENS FOR A VARIETY OF CELL TYPES IN VITRO. THERE ARE DIFFERENCES IN THE TISSUE DISTRIBUTION AND CONCENTRATION OF THESE 2 GROWTH FACTORS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    61 GVVSIKGVCANRYLAMKEDGRLLASKCVTDECFFFERLESN----NYNTYRSRKYS--S 113

Mean 42.961; Variance 69.627; scale 0.617

Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Oligonucleotides were synthesized on the basis of the amino acid sequence of bovine acidic fibroblast growth factor (aFGF) and used to produce a synthetic gene (given in 088233) incorporating codons preferred by E. coli or mammalian cells, unique cloning sites, etc. This synthetic gene was mutagenized to obtain a gene encoding a human recombinant aFGF (R74647) having activity equivalent to the native protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   W04806 standard; Protein; 140 AA.

DNA encoding FGF mutein black.

Disclosure; Page 3; 23pp; Japanese.

The invention covers muteins of FGF (esp. bFGF) which contain at least one plycosylation site. The muteins can be used to treat burns and thrombosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             LPPGNYKKPKLLYCSNGGHFLRILPDGTVDGTRDRSDQHIQLQLSAESVGEVYIKSTETG 62

                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                           Isolated, purified, biologically active bovine beta endothelial cell growth factor - useful to regenerate or treat damaged blood vessels bisclosure; Fig 8; 28pp; English.

Bovine beta-endothelial cell growth factor (beta-ECGF; W0399) having a mol.wt. of 20 kD can be purified at least 16300 fold from bovine brain using heparin-Sepharose affinity chromatography. ECGF is useful for, among other purposes, diagnostic applications and has potential in the treatment of damaged blood vessels or other endothelial cell-lined structures.

Human ECGF (137503) or fragments may be obtained using oligonucleotides (T37504 to T37509) whose design is based on the sequence of bovine alpha- and beta-ECGF.

The PF of the invention was obtd. from human brain tissue. It has a mol. wt. of 15,200-16,500 (pref. 15,616-16,056) and has a high affinity for heparinn. PFI and fragments are useful for promoting the growth of mesoderm-derived cells or neuroectoderm-derived cells and generating endothelial cell linings for vascular prostheses (all claimed). The polypeptides are useful for increasing vascularisation.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Anti-acid antibody, for cancer diagnosis, etc. - is obtd. by using complex of partial peptide(s) of acid fibroblast growth tactor and protein as antigen.

Bachosure, Fig 1; 19pp, Japanese.

The was deduced from a gene used to produce recombinant aFGF.

The was deduced from the protein, esp. from A-D can be used to as antigens to produce anti-aFGF antibodies. The peptides must comprise 8-10 continuous AAs from A or B (claims 5 and 6 resp.),

7-10 continuous AAs from C (claim 7), or 8-9 continuous AAs from D (claim 8). The Abs can be used for immunochemically measuring aFGF, and for purifying aFGF. They are useful as reagents in the diagnosis of various cancers or diseases of the CNS. Purified aFGF has wound healing and nerve cell proliferating properties.

Why according a cleavable signal peptide and an endothelial cell growth factor ruseful for producing recombinant endothelial cell growth factor roteins claim 1, Column 16, 23pp; English.

This represents the amino acid sequence of human beta-endothelial cell growth factor (ECGF). The invention is directed to DNA encoding alpha or beta-ECGF and plasmids comprising the DNA sequences. The DNA encodes a cleavable signal peptide and an ECGF, where removal of the signal peptide yields a mature form of the ECGF. The DNA is used to produce recombinant ECGF proteins, which can be used in treatments to repair or regenerate blood vessels or other structures lined with endothelial cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                isolated, purified, biologically active bovine beta endothelial cell growth factor - useful to regenerate or treat damaged blood vessels bisclosure; Fig 8; 28pp; English and the control of 20 kpp; English and the control of 20 kp can be purified at least 16300 fold from bovine brain using heparin-Sepharose affinity chromatography. ECGF is useful for, among other purposes, diagnostic applications and has potential in the treatment of damaged blood vessels or other endothelial cell-lined structures.

Human ECGF (137503) or fragments may be obtained using oligonucleotides (737504 to 737509) whose design is based on the sequence of bovine alpha- and beta-ECGF.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 77 QYLAMDIDGLLYGSQIPNEECLFLERLEENHYNIYISKKHAEKNWFVGLKKNGSCKRGPR 136

cell growth factor promoting meaning containing care accordance represents the amino acid sequence of the mature human beta-endothelial cell growth factor (b-ECGF). This amino acid sequence 10 N-terminal amino acids. The sequence was isolated from a human brain stem cell cDNA library using a probe designed based on fragments of the bovine ECGF (see W75416-W75418). The ECGF protein can be used in compositions for promoting wound healing. ECGF is also used to grow sequence 154 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         QYLAMDTDGLLYGSQTPNEECLFLERLEENHYNTYISKKHAEKNWFVGLKKNGSCKRGPR 136

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 97
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Claim 1, Column 16, 22pp; English.

Human recombinant endothelial cell growth factors (ECGF) beta (W06816) and alpha (W06817) differ only at their v-terminal ends. They can be produced in transformed prokaryotic or enkaryotic host cells using DNA sequences (T45983 and T45984, respectively) derived from the complete human ECGF cDNA (T45885). Large quantities of the ECGFs are produced by culturing the host cells and recovering the proteins. ECGFs have utility in the growth and amplification of endothelial cells in culture. They can potentially be used to treat damaged blood vessels and other endothelial cell-lined Sequence 154 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 17 LPPGNYKKPKLLYCSNGGHFLRILPDGTVDGTRDRSDQHIQLQLSAESVGEVYIKSTETG 76

Novel fusion proteins comprise FGF linked to saporin. FGF-1 to -9 may be used, pref. FGF-1 (R70812), FGF-5 (R70813), FGF-7 (R70814) or FGF-8 (R70815) muteins, in which at least 1 Cys residue is replaced by conservative Ser substitutions. The fusion proteins are potent cytocidal agents to cells bearing the FGF receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             QYLAMDIDGLLYGSQIPNEECLFLERLEENHYNTYISKKHAEKNWFVGLKKNGSCKRGPR 137

Fig 8: 43pp; English.

Example. Fig 8: 43pp; English.

To screen the human brain stem CDNA library for clones contg. ECGF inserts, a specific oligonucleotide was designed. This coligonucleotide was based upon a partial AA sequence analysis of the amino terminus of ECGF (see F70480 and P70481). Fig 3s sets footh for comparison the AA sequence of cyanogen bromide-cleaved bovine alpha and beta ECGF (P70834). The two clones that were isolated, ECGF clones 1 and 29, were analysed in further detail. The nucleotide sequence of these clones and the AA sequence deduced from the nucleic acid sequence is shown in Fig 8 (see W70788 and P70482).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            78 QYLAMDTDGLLYGSQTPNEECLFLERLEENHYNTYISKKHAEKNWFVGLKKNGSCKRGPR 137

EMBO J. (1988) 7:959-962
Endothelial cell growth factors in embryonic and adult chick
brain are related to human acidic fibroblast growth factor.
                                                                                                                                                                                                                                                                                                                                           The acidic and basic fibroblast growth factors are the major endothelial-cell growth factors. Both are anglogenic agents in vivo and are potent mitogens for a variety of mesodern-derived cell types in vitro (although bFGF is 30-100 times more potent than aFGF in stimulating the proliferation of normal diploid cells). There are differences in the tissue distribution and concentration of these two growth factors.

This protein binds heparin, although less strongly than does bFGF. There are some sequence similarities between residues 117-126 (a

The acidic and basic fibroblast growth factors are the major
endothelial-cell growth factors. Both are anglogenic agents in
vivo and are potent mitogens for a variety of mesoderm-derived
cell types in vitro (although brGF is 30-100 times more potent
than arGF in stimulating the proliferation of normal diploid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This protein binds heparin more strongly than does aFGF.
